Data Storage

Store X1 states and restore them after a restart or on demand.

GIRA X1

Data Storage

Data Storage keeps the latest input value across an X1 restart. It outputs the value automatically or on trigger, so a required state can be sent back onto the KNX bus. Its send-on-change function also retains the last comparison value across the restart, avoiding unnecessary actions for unchanged states.

In practice

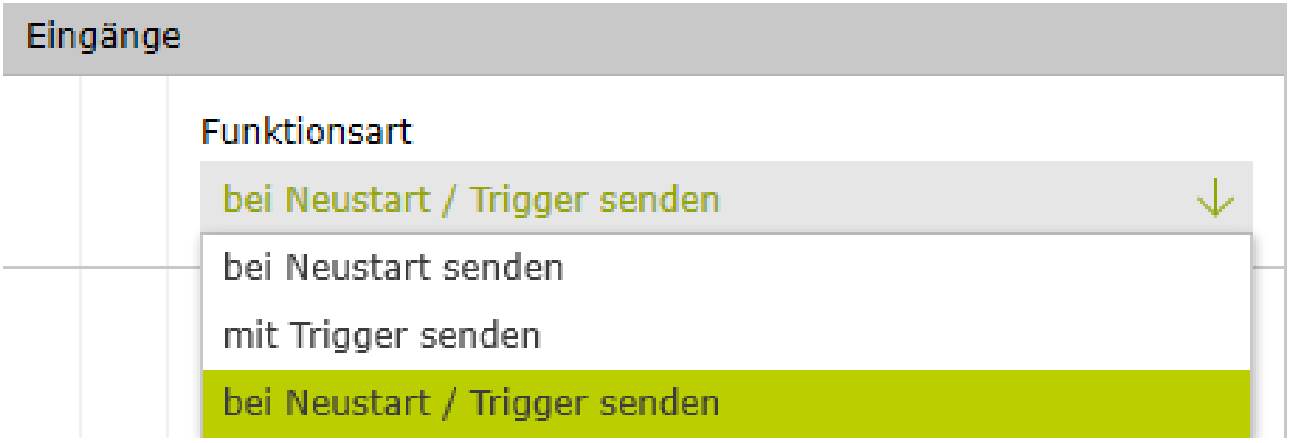

After an X1 restart, the last ventilation mode should still be available. The stored value is output automatically or on demand through a trigger.

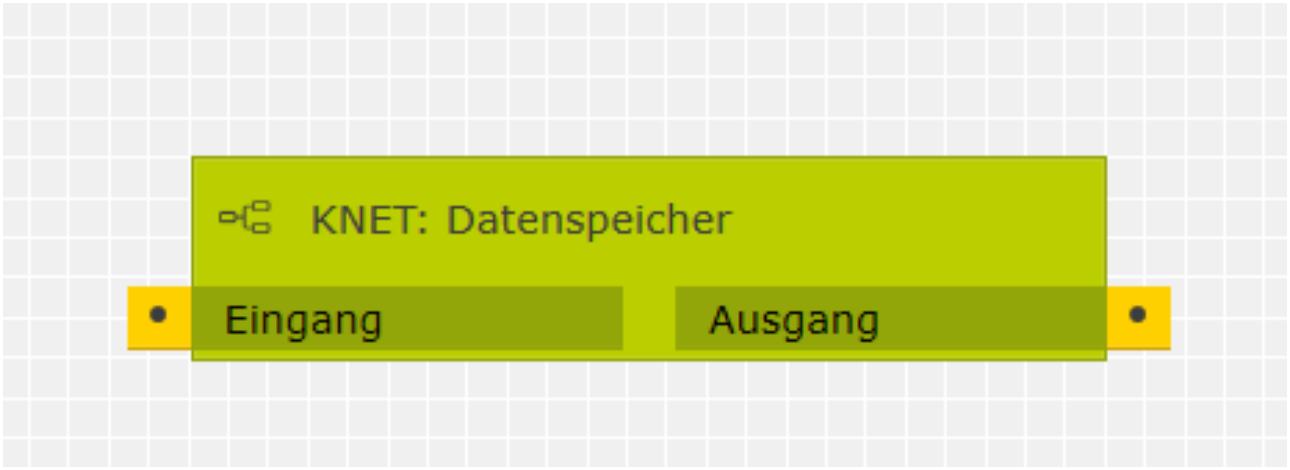

Features

- Store input values regardless of data type
- Keep the last value across an X1 restart
- Output the stored value automatically or on trigger
- Use Send by Change with a retained comparison value

Requires a Gira X1 and a suitable GPA version. The exact package and licence version will be checked before release.
